

Tablet devices and desktop mode

Commerce Vision's CMS enables you to define widget and banner display options by device, as described in the article [Mobile, Tablet, and Desktop display options](#).

However, it's important to note that some tablet devices may display sites in desktop mode by default, instead of identifying themselves as a tablet device.

For example, as of iOS13, iPads will render the desktop version of a site instead of requesting the mobile or tablet version.

Other vendors may follow suit. Hence, "tablet" specific display options may not have the intended effect due to these changes, and will need to be considered for your implementation.
