## New Features

- [BPD Dashboard page](#) — A standard BPD Dashboard page template has been created, for use with the Dashboard widget.
- [Ability to show APN instead of product code](#) — BPD now supports the ability to display the APN (Australian Product Number) instead of the product code. Fast Order Entry widget can also search by APN.
- [Improvements to SEO route creation](#) —
  - Added new flag (Overwrite SEO URL For Non-Empty Routes) to control whether existing SEO URL's are overwritten. When turned on, the SEO URL's are always overwritten. When turned off, the SEO URL's are only changed if the existing SEO URL is blank.
  - Added new flag (Use SEO URL Category Prefixing On Products) to control whether to add category prefixing to product SEO URLs. When turned on, the SEO URL will be prepended with a category hierarchy. The format of the SEO URL is determined by a resource: rcCategoryPrefixingOnProducts (e.g. `/1/2/3/4/ProductSeoUrl` where the number represents the level in the category hierarchy).
  - Changed any occurrence of "&" to "and" when saving SEO URLs.
- [Role and account exclusions for Layers](#) — Layer Add/Edit now provides a checkbox under Roles, Accounts and Bill-To Accounts which negates the restrictions. So, for example, if you have a role in the list then all roles BAR that role can access the layer.
