Overview

Your company may have multiple linked CV websites under its organisational structure and control. Examples include corporations with multi-brand websites, businesses that offer distinct sets of products /services on different websites or with separate ecommerce stores in different regions. Or perhaps you're a franchiser-franchisee network and head office needs to manage content and layout so that there is a consistent standard look and feel across all franchisee sites, enable updates and rollouts of promotional campaigns on many sites at the same time,

On the CV ecommerce platform, *linked* websites are all sites that are grouped under the same *Organisation Id*. Whether individual websites are very different or similar to each other, there may be occasions for content to be shared across these sites or controlled by a source site.

Multisite Content Management allows content sharing and control on *linked* websites grouped under the same *Organisation Id*.

What is content sharing and control?

- **Content Lock** lets specific content items to be locked on a website. Locked items can only be edited, deleted or unlocked by the Admin or Content Admin roles.
- **Deploy Content** allows content items from a source website to be copied over to one or more target websites remotely. Used with Content Lock, lockable content items can be copied over in 'locked' status. This prevents *any* CMS user of the target site from editing or deleting that item. They can view the item (except for widgets).

Can my business use Multisite Content Management?

Content Lock and Deploy Content can be used separately or in tandem, to provide solutions for a variety of purposes.

- **Want content items to just be shareable across sites without adding publishing control?** Enable Deploy Content only. This allows a non-lockable content item from any one site to be copied and published on any other site(s). It can always be edited and deleted by the target site's CMS users.
- **Want some content items to be controlled by a single source site?** Enable Content Lock *and* Deploy Content. Non-lockable content items can still be shared, unrestricted. But now, a lockable content item in 'locked' status can also be sent to be published automatically on the target site. The locked icon next to the item tells CMS users there that they cannot edit or delete it. To free the locked item for editing on the target site, just deploy that content item again, this time in 'unlocked' status.
- **Want content control as a single site business?** Enable Content Lock only. Take advantage of the Role-based permissioning to restrict publishing of locked items to specific CMS roles or users.

How does content control work?

There is a new Role in CMS called Content Administrator. Together with CMS Admin, they can enable/disable Content Lock and Deploy Content as feature settings.

The screenshot shows the 'Feature Management' interface. On the left, the 'Content' feature is highlighted, and the 'Content Lock' toggle is turned on. Below this, a note states: 'Commerce Vision enables Content Lock on your website(s)'. An orange arrow points from the 'Content Lock' toggle to the 'Roles' section on the right. The 'Roles' section lists the 'Content Administrator' role with the following permissions: 'ManageContentDeployment - Manage Content Deployment', 'ManageContentLock - Manage Content Lock', 'ManageLinkedSites - Manage Linked Sites', and 'ViewContentDeployment - View Content Deployment'. To the right of the roles list, a note for 'CMS Admins' states: '- assign user(s) to new **Content Admin** role with these default permissions *' and '- other roles can view but not edit content'. A second orange arrow points from this note to the 'ManageContentLock' permission. A third orange arrow points from the note '* some are for use with **Deploy Content**' to the 'ViewContentDeployment' permission.

Content Lock
Enable the ability to lock down parts of the CMS

Commerce Vision enables Content Lock on your website(s)

Roles

Content Administrator

- ☒ ManageContentDeployment - Manage Content Deployment
- ☒ ManageContentLock - Manage Content Lock
- ☒ ManageLinkedSites - Manage Linked Sites
- ☒ ViewContentDeployment - View Content Deployment

CMS Admins:

- assign user(s) to new **Content Admin** role with these default permissions *
- other roles can view but not edit content

* some are for use with **Deploy Content**

Viewing locked and deployed content on target sites

To allow users of target sites to view (but not edit) locked content deployed from source sites, ask Commerce Vision to ensure their Roles have **View Content Deployment** permission enabled.
