

Content: Deploy Content - Remote Multisite Content Publishing

Are you a multisite organisation wanting to share content easily across your websites? **Deploy Content** allows management of shared content across multiple websites linked to one organisation.

Shareable content types include pages/templates, articles, banners, campaigns, section menus, role settings, product features, and online-maintained product and category details. Individual content items created on one site can be copied over to one or more other sites with just a few clicks.

More Info ...

Use Deploy Content with the Content Lock feature to allow a source site to remotely control specific content on target sites by sending locked content objects. Locked content cannot be edited on the target sites. This solution is ideal for organisations that want to keep the 'look and feel' of related sites consistent. For instance, a franchise head office deploys locked pages or even just locked parts of a page for branding reasons. Or controls a franchisee-wide promotion campaign by creating it on the source site and deploying it to all sites at the same time. And when you want to unlock content on a target site, it's simple. Just re-deploy the content in unlocked status.

Benefits

- Deploy the same content to multiple sites at one go.
- Select only the target sites you want for a specific deployment.
- Add and deploy content items locked when you want to prevent changes. (Applies to lockable content types only.)
- Lock and unlock content items remotely from the source site. (Applies to lockable content types only.)
- Access the Content Deployment Log to check deployment results or look up historical deployment records. (Available also to CMS users on target sites.)
