

# Integrator Settings - Internet

The Internet tab of the Integrator Settings is where web connection and server information is configured.

## Step-by-step guide

To Maintain Internet Settings:

1. Open the Integrator client and click the **'Settings'** icon.

2. Click the **'Internet'** tab.

3. Set the values for each field; refer to the table below.

4. Click **'Apply'** then **'OK'**.

Web Site Configuration

Web Site URL :http://yoursite.com

Web Services URL :http://yoursite.com/WebServices.asmx

Connection ID :LIVEID

Branch ID :

Web Timeout :120seconds

Account Code :

XML Records Sent per Batch :100

☐ Use dedicated server for Web Services

☐ Use Secure Sockets Layer (SSL)

Proxy Settings

Server IP :Port :

Username :Password :

Domain : ☒ Bypass proxy for local addresses

Apply these Proxy Settings to all Sites

Field	Description
Web Site URL	The URL of the website (e.g. <a href="http://yoursite.com">http://yoursite.com</a> ).
Web Services URL	The URL of the website, appended with 'webservices.asmx' (e.g. <a href="http://yoursite.com/webservices.asmx">http://yoursite.com/webservices.asmx</a> ).
Connection ID	The unique Connection ID of the website (Commerce Vision can provide this)
Branch ID	The Branch identifier (for multi-branch sites).
Web Timeout	The time, in seconds, that an operation will keep trying for until it gives up. Generally set to 120 seconds.
Account Code	Leave blank (field no longer in use).

XML Records Sent per Batch	<p>This value determines how many XML records the Integrator will process at one time. Keeping the number low will reduce processing time.</p> <p>Please note: All files will be processed on each send; batching simply prevents time-outs on very large files.</p>
Use dedicated server for Web Services	Leave blank (functionality no longer in use).
Use Secure Sockets Layer (SSL)	Tick this box for HTTPS sites where data encryption is required. Using this functionality unnecessarily will result in increased processing and data overhead.
Server IP	The IP Address of the proxy server.
Username	The username for proxy authentication.
Domain	If proxy authentication is required, the authentication domain.
Port	The proxy server port number.
Password	The password for proxy authentication.
Bypass proxy for local addresses	Tick this box to bypass the proxy server when connecting to local addresses.

The '**Apply these Proxy Settings to all Sites**' button will update all sites (LIVE, STAGE, DEV, etc) to use the proxy settings specified here.
