

Version 4.01

New Features

- [Order Approval button placement](#) — A new option (*Approval Buttons Placement*) has been added to the [Orders Approval Widget](#). This option allows you to display the approval buttons above the order, below it, or in both locations.
- [File Manager enhancements for Move / Copy](#) — Is your website running version 4.01.00 or higher? If so, you can now enjoy lightning-fast moving & copying in our [updated CMS File Manager](#). 40+MB folders now process in under 2 seconds.
- [New Promo Code scenario](#) — We've added another promo code scenario to the CMS toolkit! Now, you can offer a product at a discounted price when your customer buys a specific quantity of another product.
- [First & Last Name fields for Guest Checkout](#) — A new option (*Capture First and Last Name Separately for Guest Users?*) has been added to the [Delivery Address B2C Widget](#), allowing the split capture of guest First and Last names. This allows for more consistent transfer of user information to zipMoney, ensuring a higher rate of instant approvals and less manual intervention on zip orders.
- [Product Documents via CMS](#) — You can now [upload documents for products in the CMS](#), similar to the way you might already manage other product media. A new [Product Documents widget](#) is available to be added to the product detail page.

This widget can display all documents associated with a product, or you can use tags to display only certain documents (combine tags with [Layers](#) to personalise your content!)

- [New Lucene Search option to remove plurals](#) — A new option has been added to the Lucene search function within BPD, allowing for the removal of plurals from search terms. This means that a search for "microphone stands", for example, becomes a search for "microphone stand". Removing plurals will generally yield more complete search results for the end user. (As this new setting ('AllowPluralsRemovalForSingleSearch') is currently only accessible via the database, please [contact us](#) if you'd like to enable it.)
- [Remember my card details](#) — A new tickbox has been added to the checkout payment options via eWay, allowing the user to remember their credit card details for next time.

This tickbox will only render if the site is using **Authorise & Capture** mode for credit card payments, and the user *role* has "Enable Payment Provider CustomerID Token Retention" enabled.

Fixes

- [Price filter appearing in error](#) — In some scenarios, the option to filter by Price was displayed on the product list page when it shouldn't have been (i.e. the 'Show Price Filter' option was **not** enabled on the widget). This has now been fixed.
- [Deleting orders on hold](#) — In some scenarios (e.g. immediately after an order is placed on hold), the user is unable to delete said order. This issue has been fixed and you may now delete to your heart's content.
- [Infinite scroll behaviour with filters](#) — In scenarios with Infinite/endless scrolling enabled, some product filters were being dropped as the user reached the end of the 'page'. This happened when the user had multiple filters selected and then scrolled past the first set of results. The issue has now been fixed and all selected filters are retained!
- [Ordering of Recently Viewed products](#) — In some versions, the order of products displayed by the [CopyRecently Viewed Products Widget](#) did not reflect the order the user viewed them in. They were instead being sorted by product code. This issue has now been fixed.
- [Pay Account dates affected by Daylight Saving](#) — Dates against invoices on the Pay Account page were being affected by a Daylight Saving setting at the user PC level.
If the computer's Date & Time setting "Adjust for daylight saving time automatically" was enabled, the date would display incorrectly in some scenarios. This has now been corrected.
- [Recently viewed products in Custom Catalogues](#) — In some scenarios, the [CopyRecently Viewed Products Widget](#) was not rendering on product pages within a Custom Catalogue. This has now been corrected.
- [Speed improvement for Edge & IE11](#) — We've completed some performance enhancements to address sluggish responses in Edge and IE11 browsers. Some users were experiencing delays when viewing order templates containing 100s of products.
- [Refresh of charge lines in Cart Preview](#) — Some users reported incorrect charges in the [CopyCart Preview on Hover](#). This could occur when the user switched roles, as the cart preview was not refreshing the freight lines. The issue has now been fixed.
